

RIGHT VS LEFT

New research efforts suggest there may be a difference in biology, depending on the side the cancer originates, right versus left (aka sidedness). Based on the research, it's suggested that patients with right-sided tumors may not have the same results and success rates if EGFR-inhibitor therapy is used as the first-line of treatment compared to patients with left-sided tumors.

Research is continuing in this area, so if you have questions, check [FightCRC.org](https://fightcrc.org) and ask your doctor about whether or not your treatment plan will be different based on the "sidedness of your tumor."
